

PS Count-Down Checklist Worksheet

PX # from figure 2	Count down days	Use this pole shift count-down checklist worksheet to keep track of your observations during this time. The following is a human understanding of the key sequence of events from the clues left by the Zetas of Zetataalk (http://www.Zetataalk.com/). It takes into account some amount of current understanding of the mechanics of the situation to align Zeta statements into a most likely sequence of events to end up with an approximate most probable end date.	Approximate time frame plus or minus up to a week	Fill in your observed dates
1	54	PX (Planet X) is within days of the crossing of earths far side orbital path on the other side of the sun. It is coming in at an ever increasing fast rate.	5-Apr-13	
1	53	Two years after the PS (pole shift), due to melting polar caps, and many other factors, sea levels will rise, an estimate some 675 feet above current levels. Choose your location with this in mind.	6-Apr-13	
1	52	Earth's North rotational axis has been slowly tilting away from the sun for a while now that may be resulting in cooler than normal weather.	7-Apr-13	
1	51	7.3 weeks the before pole shift, PX is starting to be visible to naked eye in the direction of Orion : First as faint reddish blur, later to look like a cross, then eventually as a winged globe with comet like tail and swirling moons.	8-Apr-13	
1	50	It will get to be almost the size of the moon at the time of passage at 14 million miles away. At all times it is expected to be red to deep red and may never be a distinct image due to all of the red iron oxide dust around it.	9-Apr-13	
1	49	Its now 7 weeks before PS. During this time frame many more will start to see PX for the first time. Orion will be east of the sun (facing the sun) along the ecliptic (daily path of the sun) . Look for it just as soon as it is dark and in the direction of the sunset near Orion.	10-Apr-13	
1	48	How to find Orion: Facing sunset, Orion will be found along the past path of the sun at a given angle above the sunset. 1 April = 4 hr(60 d), 15 April => 3 hr(45d), 1 May => 2 hr(30d), 15 May=> 1 hr(15d), 1 Jun => 0 hr(0d) (PX in front of the sun) --- 1 hour angle (hr) = 15 degrees (d). For viewing times after sunset subtract this time from the date time before translation to degrees.	11-Apr-13	
1	47		12-Apr-13	
1	46		13-Apr-13	
1	45		14-Apr-13	
1	44		15-Apr-13	
1	43	Expect most will be able to see PX with the naked eye around this date.	16-Apr-13	
1	42		17-Apr-13	
1	41		18-Apr-13	
1	40		19-Apr-13	
1	39		20-Apr-13	
1	38		21-Apr-13	
1	37		22-Apr-13	
1	36		23-Apr-13	
1	35		24-Apr-13	
1	34		25-Apr-13	
1	33		26-Apr-13	
1	32	Look in the direction of Venus. PX should be close to it as it passes by on or near this date.	27-Apr-13	
1	31		28-Apr-13	
1	30		29-Apr-13	
1	29		30-Apr-13	
1	28		1-May-13	
2	27	Look for PX to be close to the sun. PX passes just south of the sun on or near this date.	2-May-13	
2	26		3-May-13	
2	25	Start of 18 day of Earth Slowing Rotation. This is the start of a 270 degree roll of earth's axis that ends with rotation stoppage and the pole shift.	4-May-13	
3	24		5-May-13	
3	23		6-May-13	
3	22		7-May-13	
3	21		8-May-13	
3	20		9-May-13	
4	19	PX crosses ecliptic to make Zeta triangle. PX's tale sweeps across earth, red dusting, waters turn red.	10-May-13	
4	18	Earths North rotational axis continues to tilt away from the sun Earth's axis is tilted to the right (facing the sun) in Northern hemisphere. The suns path (ecliptic) looks tilted to the left. At some point the sun appears to rise in the North east and set in the south west.	11-May-13	

PS Count-Down Checklist Worksheet

PX # from figure 2	Count down days	Use this pole shift count-down checklist worksheet to keep track of your observations during this time. The following is a human understanding of the key sequence of events from the clues left by the Zetas of Zetatalk (http://www.Zetatalk.com/). It takes into account some amount of current understanding of the mechanics of the situation to align Zeta statements into a most likely sequence of events to end up with an approximate most probable end date.	Approximate time frame plus or minus up to a week	Fill in your observed dates
4	17		12-May-13	
4	16	9 days of Severe Wobble. Strong winds, and sloshing water (oceans) result.	13-May-13	
5	15	3 Days of darkness for the Northern hemisphere.	14-May-13	
5	14	The Earth changes will increase dramatically. Devastating quakes, collapsing cities, monstrous tidal waves, and disruption of services - power, gas, water, and phone. Bridges will be down, roadways torn, the atmosphere so volatile that planes cannot be safely lofted.	15-May-13	
5	13		16-May-13	
6	12	6 days of Sunrise West. Earth is upside down continuing to rotate in the same direction.	17-May-13	
6	11		18-May-13	
6	10		19-May-13	
6	9		20-May-13	
6	8		21-May-13	
6	7	Slowing rotation will be such that over two days, one will notice minutes lost then hours then stopped. The most probable stopped orientation would be with Earth's south direction or southern hemisphere pointed toward the sun with the Atlantic trench facing PX. The Northern hemisphere would be mostly in twilight and/or darkness.	22-May-13	
7	6	Stopped: 6 (5.9) days of NO earth rotation on its axis. Earth is groaning and making noises as geological changes take place throughout the world. The core is trying to turn and the crust is held magnetically at the Atlantic trench facing PX. Plate slippage is taking place in a direction away from the Atlantic trench.	23-May-13	
7	5	All travel and traffic will be stopped, all communications down, the world frozen in horror, waiting for the next blow. The Earth is stopped in it's orbit around the sun, now being drawn in closer to PX.	24-May-13	
7	4	Cities imploding, bridges and roadways and rail lines distorted, all the infrastructure of man's civilized existence rupturing.	25-May-13	
7	3	Earth is hot on sun side and cold on the dark side. Increased wind helps stabilize temperature.	26-May-13	
7	2	Endless moaning and a continuously trembling Earth. Strong and unusual windstorms.	27-May-13	
7	1	Red dusting is a countdown clue , that only hours remain. Hailstones and firestorms may follow the red dusting (Iron oxide) and are another clue of only hours to the shift.	28-May-13	
8	0	The Pole shift with high magnitude earthquakes (9-10+) and hurricane winds (approximate 100 MPH) is over in slightly less than 1 hrs time. New north pole is just off the coast of Brazil. New south pole is off the coast of India. At first there is a vibration of sorts, a jiggling, as the crust separates in various places from the core. Then there is a Slide, where the crust is dragged, over minutes, to a new location, along with the core. During the slide, tidal waves move over the Earth along the coast lines, as the water is not attached and can move independently. The water and the atmosphere tends to stay where it is, the crust moving under it, essentially. When the core finds itself aligned, it churns about somewhat, settling, but the crust, more solid and in motion, proceeds on. This is in fact where mountain building and massive earthquakes occur, just as car crashes do their damage on the point of impact, when motion must stop. See shallow trench covered with sheet metal (http://www.zetatalk2.com/poleshft/p177.htm) as a recommended way to survive.	29-May-13	
9	1		30-May-13	
9	2	Earth's rotation starts as PX rapidly moves on out.	31-May-13

		See Zetatalk after-time http://www.zetatalk.com/xtime/x00.htm and transformation http://www.zetatalk.com/transfor/t00.htm files for details of what happens next.		
		See TT (Troubled Times) http://www.zetatalk.com/thub00.htm and http://www.pssurvival.com/ for long term survival information.		
		Astronomical events that are (calculated by earth's sciences) during this time frame.		
		Annular solar eclipse on 10 May 2013 at 0:26:20		
		Full Moon 25 May 2013		

PS Count-Down Checklist Worksheet

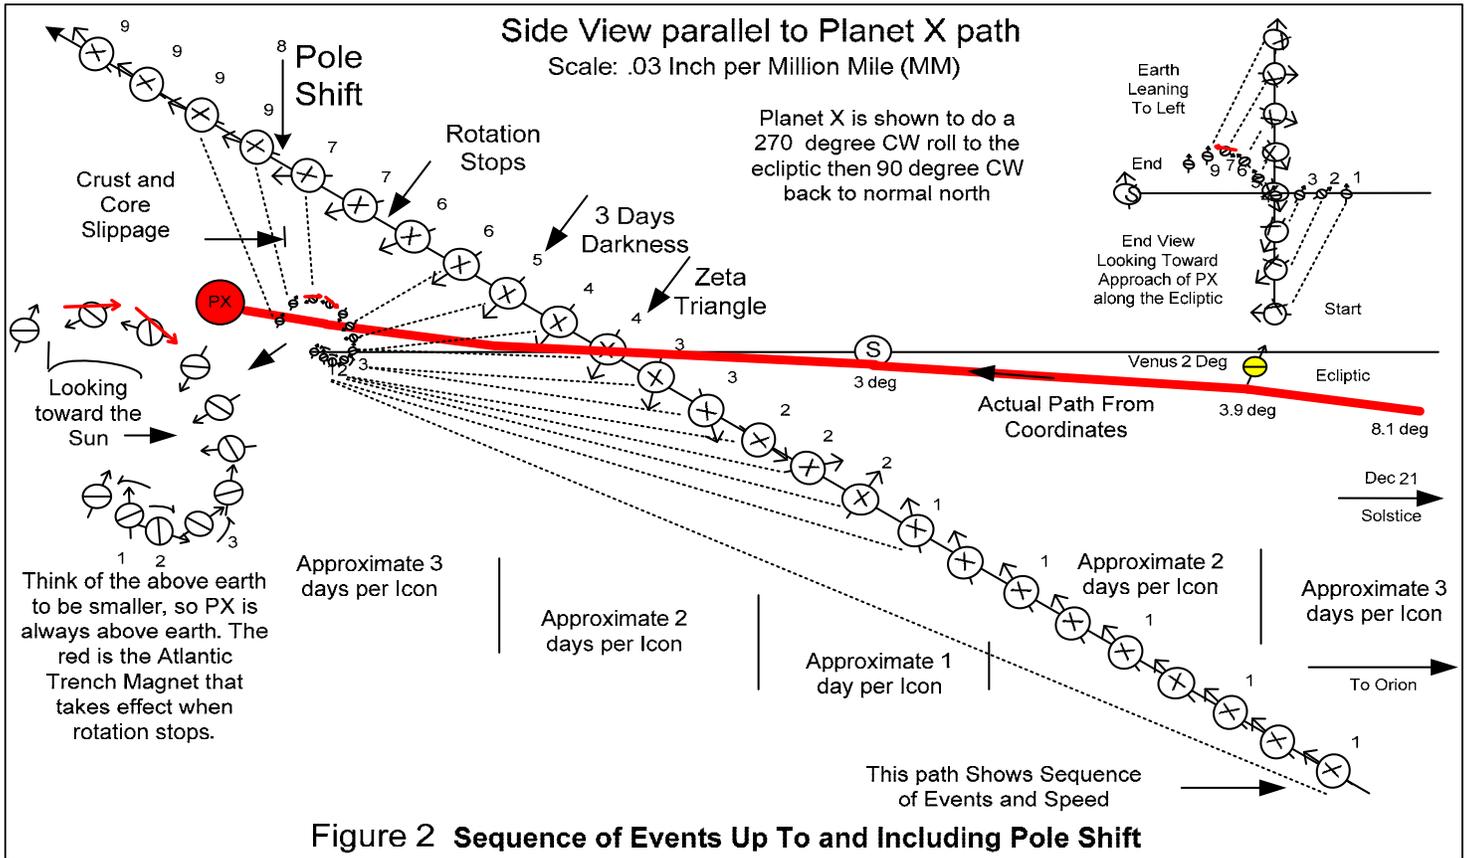

Figure 2 Shows a side and end view of the sequence of events. The red path for PX is drawn to scale to show roughly how close Venus and PX come to each other and how close PX gets to earth. Earth is expected to be pulled around a bit as show in the expanded view of earth's movement. The diagram shows PX passing though earth's motion icons. This is not true. I just couldn't shrink it down enough on this diagram and still see where the stages are. Consider this much smaller in motion and that PX passes over the top and to the left side of earth. Figure 5 and 6 show this better. Note the red arrow pointing in the opposite direction from earth's poles. This represents the magnetized iron in the Atlantic trench that cause a shift in earth's orientation (180 degree end for end flip of the earth) during the 6 days the planet has stops rotating. The sequence of events line shows functionally what happens with coupling magnetic fields for earth and PX (X). It also shows the effect of the suns magnetic field on PX. PX speeds up as it gets close to the sun and slows down after the sun. .

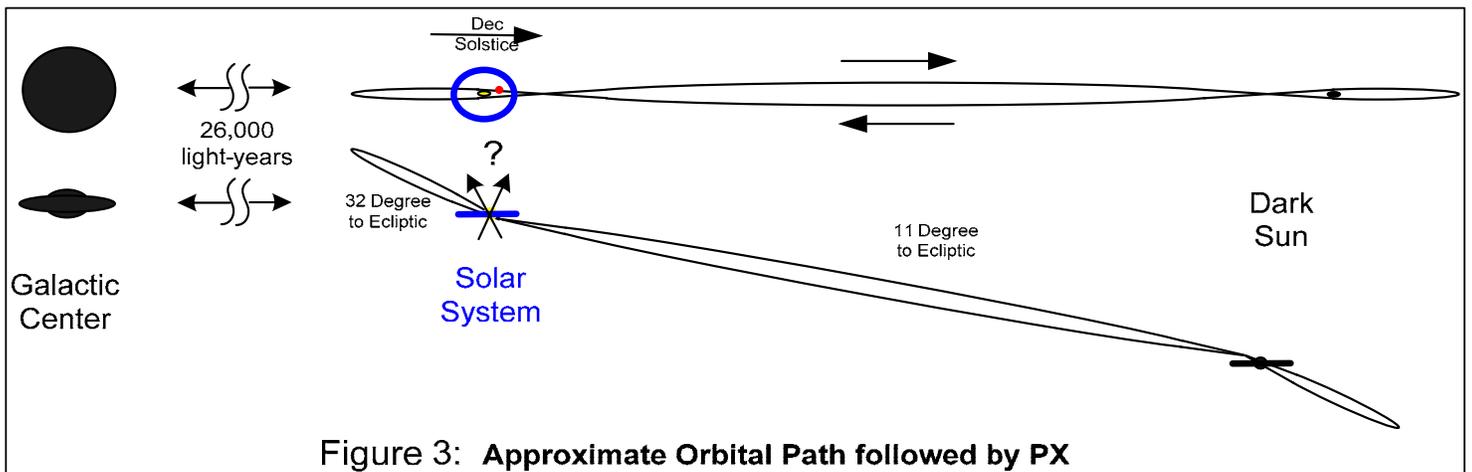

Figure 3 shows the overview orbit of PX between our sun and the dark star. The blue orbit is Pluto. The drawing is a bit off in that it should show the "close together lines" right at or very near the sun. Whether the orbit of PX crosses or comes close and continues it's retrograde motion is speculation at this time. If it crosses it would most likely be after the sun from my current understanding. At any rate this information is not needed to be understood to discover the PS date.

PS Count-Down Checklist Worksheet

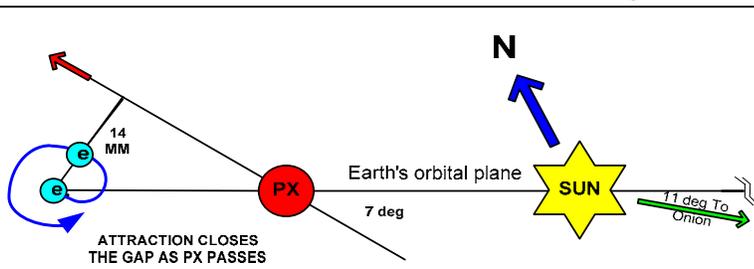

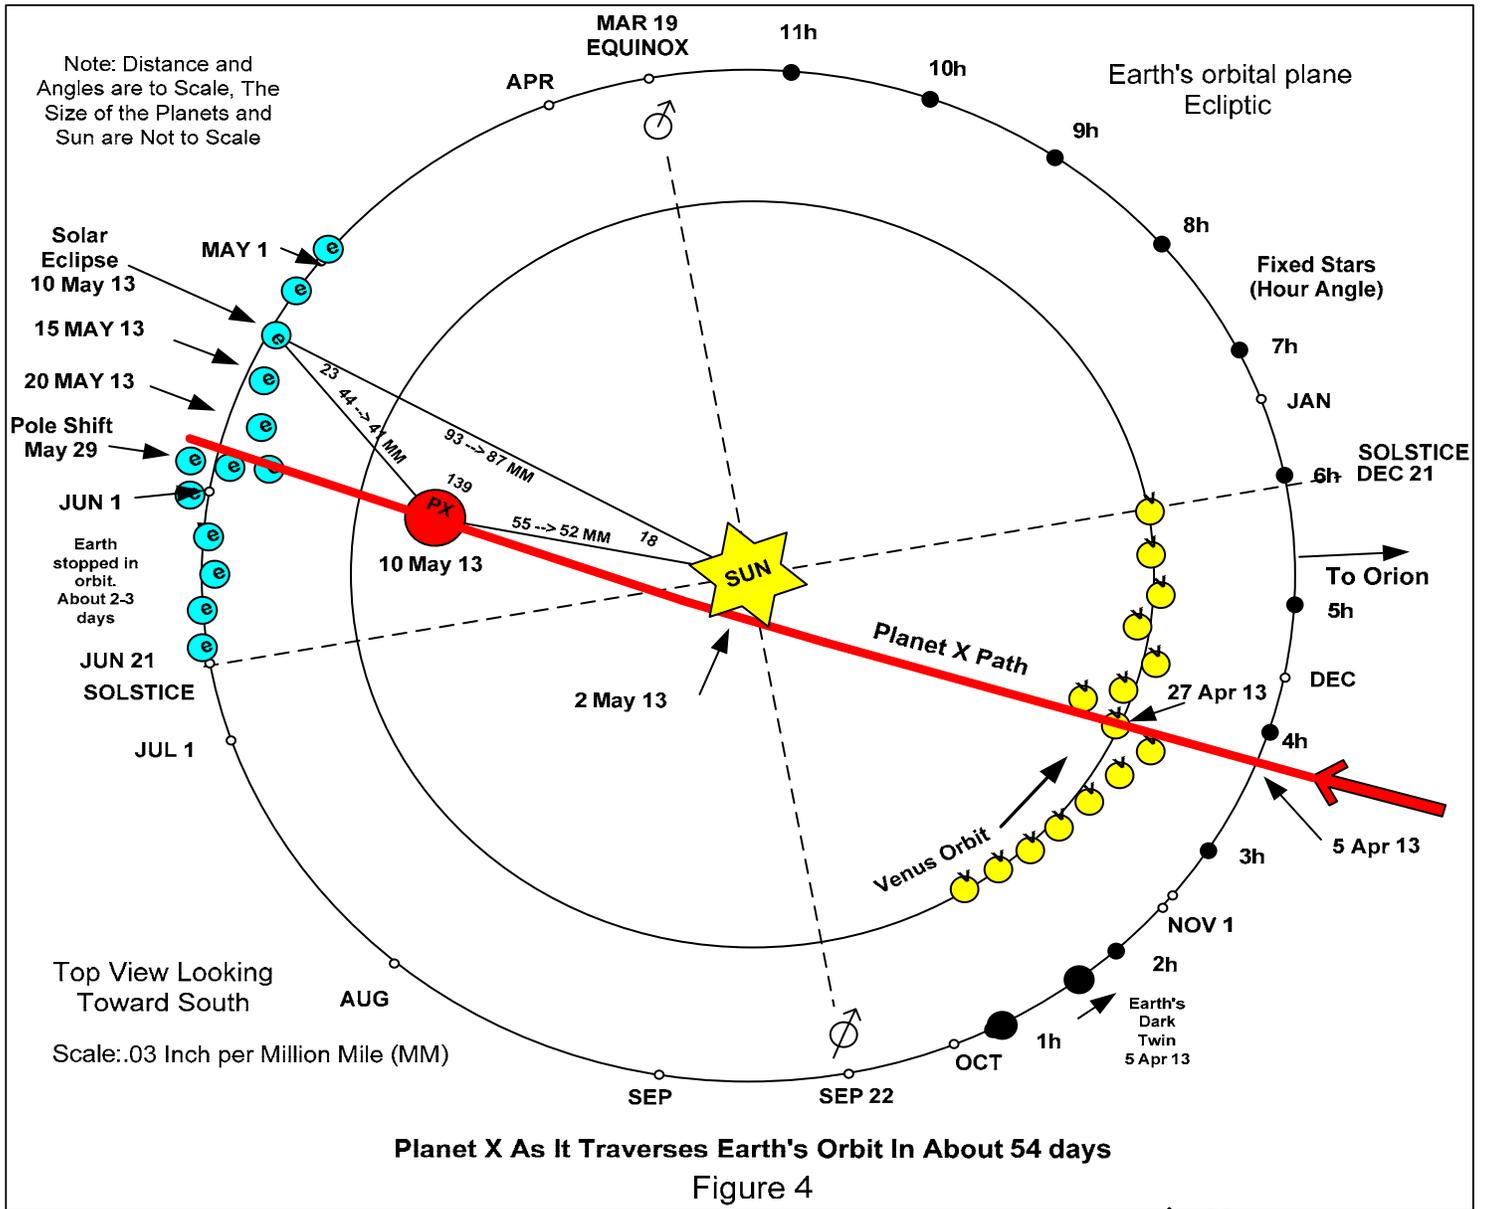

Figure 5
Side View

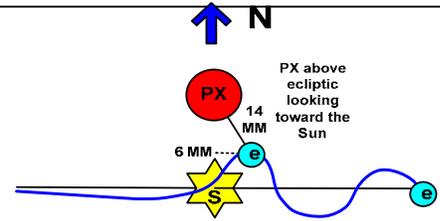

Figure 6
Viewed Toward Incoming PX

Figure 4 shows the path of PX as it comes in from Orion. The earth's dark twin is pulled further along in its orbit around the sun nearer to incoming PX during the 1 April 13 through 27 April 13 time frame. PX passes Venus on or about 27 Apr 13. It passes the sun approximately 2 May 13. It is at the Zeta triangle or passes through earths ecliptic on or about 10 May 13 resulting in a Pole Shift in the vicinity of approximately 29 May 13. There are lots of forces and timings in play beyond what we can guess at, at this time, thus we give it a plus or minus week window. The 5 April 13 date as it crosses the earths orbit is approximate. It is estimated to be some time between 3 April 13 and about 11 April 13. For details on determination and further discription of these figures see "-Update_on_PS_Date_Determination_Jan 2013. pdf"
